

REVISED LOAD - SHEDDING SCHEDULE

EFFECTIVE 7 APRIL 2015

New requirements by Eskom, technical reliability and feedback from our customers have necessitated a revision of the existing schedule. The new schedule entails switching off widespread areas at our High Voltage Substations and seeks to minimise interruptions and introduce more fairness in the allocation of Blocks. It will also reduce the incidence of customer Block changes due to network faults.

Each High Voltage Substation is categorised as largely Residential, largely Commercial or largely Industrial. A point to note is that some Residential or Commercial customers may be categorised as Industrial and fall within these Blocks and vice versa. It is difficult to correctly categorise each individual customer owing to the nature of the electrical network i.e. interconnectivity, hence we can expect some discrepancies.

The new schedule consists of four stages with the rotation in the **most likely** period of load-shedding (06:00 - 22:00, Monday to Saturday) as follows :-

Stage 1 : Residential/Commercial Blocks - load-shed once every second day

Stage 2 : Residential/Commercial Blocks - load-shed once every day

Stage 3 : Residential/Commercial/Industrial Blocks - load-shed once every day

Stage 4 : Residential/Commercial/Industrial Blocks - load-shed once every day. Residential and Commercial will be shed for an additional block on alternate days

All Blocks are scheduled for a 2 hour outage with an additional 30 minutes contingency to cater for switching. Sometimes, technical difficulties in restoring electricity may occur and should a customer remain off for a substantial amount of time after the Block has been scheduled to be restored, then that incident must be treated as a fault and reported to the Electricity Contact Centre on **080 1313 111**.

During load-shedding, customers are urged to switch off appliances to prevent overload trips which may result in extended outages. Switching off sensitive electrical appliances before power is restored also prevents the risk of voltage spikes and subsequent damage to equipment when power returns.
